

Analysis of A/B Test Results

Data Scientist: Marcos Roberto Souza

Agenda

Findings of A/B test analysis

- Experiment Setup
- Conversion Rates
- Experiment Results

How Was the Experiment Implemented?

Total Variant Visitors: 35211

Total Control Participants: 34678

Conversion Rates

	U.S.	U.K.	CA
Control	10.7%	10.16%	9.44%
Treatment	15.8%	14.87%	15.40%

Executive Summary: The treatment group consistently outperforms the control across all countries, with ~5 percentage points higher conversion rates. Country of origin has minimal impact on conversion.

Group assignment (treatment vs. control) is a stronger predictor of conversion than country. These results suggest the treatment page leads to meaningfully higher conversion rates.

Experiment Results

- Treatment Conversion Rate: 15.53%
- Control Conversion Rate: 10.53%
- Delta in Treatment vs. Control Conversion Rate: +5.00 pp
- p-value: ≈ 0.00
- Conclusion:
 - The p-value is effectively 0, well below the 0.05 threshold, so we reject H_0 . There is statistically significant evidence that the treatment page leads to a higher conversion rate. The takeaway is that the company should consider adopting the treatment page, as it consistently outperforms the control across all countries.
